

Shiras Moose Hunt FAQ's

What's the average size for a Bull Moose?

Shiras moose are the smallest of the three subspecies found in North America. The average width of a mature bull moose in our area is 36 to 55 inches. They can weigh up to 1200 lbs and stand over 6 ft tall at the shoulder.

What sort of success rate do you normally have?

On [Shiras moose hunts](#) our opportunity rate is 100%, and our harvest rate is around 85%. There is a healthy population in the area and plenty of feed throughout the year to keep the population large. A Shiras moose hunt goes well if paired with an elk, bear or deer combo.

How physically demanding is it?

Moose hunting is pretty easy physically, most people can do it and have success. Moose are found along the main river and low in the avalanche slides, both are very accessible. One can expect to walk a few kilometers everyday, glassing and calling along the way in search of a trophy bull.

How do you hunt them?

Our main tactics are spot and stalk and calling, spot and stalk is our go to method in our southern concession cause of the country we are able to glass over to locate a trophy bull moose. Calling works well during the second rut, when the un-bred cows search for a male counterpart.

What time of the year is the best to come?

If you want to pair this hunt with an elk then the middle of October is the best to come. If it's a moose only then later October or early November is the best time. When snow is on the ground it forces the moose to travel more in order to find food and to stay warm.
